

Person 1 – Task Document

Name: Auckenthaler Douma Nils
Role: Analysis (completed) + Implementation Module A

1. Completed Work

- ✔ **Analysis Phase**
Created the Software Requirements Specification (SRS) covering all functional, non-functional, and data requirements.
File: *TechConnect Software Requirement Specification.pdf*

2. Current Assignment: Implementation Module A

Module A: User Registration, Authentication & Profile Management
Based on SRS: Sections 4.1, 4.2
Based on DDS: Sections 7(Core Pages), 12 (User entity), UI consistency rules

Tasks

#	Task Description	Deliverable/Expected Outcome
1	Set up Firebase project, enable Email/Password authentication.	Firebase config file, project ready for team use.
2	Create <code>signup.html</code> with role selection (Skilled/Client), email, password fields.	Responsive sign-up page following DDS color/font choices.
3	Implement Firebase Auth sign-up (JS) + OTP verification (Firebase phone/email verification).	Working sign-up flow, user stored in Firebase Auth.
4	Create <code>login.html</code> and password reset page.	Login works, reset email sent from Firebase.
5	After auth, store extra profile data in Firestore (<code>users</code> collection): name, role, rating(0), bio, profileImageUrl.	Database entry created on first login/registration.

#	Task Description	Deliverable/Expected Outcome
6	Create <code>profile.html</code> – editable bio, profile picture upload (Firebase Storage), skills list (add custom skills).	Profile page reads/writes to Firestore, matches DDS.
7	Build reusable "Skill Selector" component (predefined skills from DDS + custom input).	Consistent skill selection across app.
8	Style all pages with DDS color system (choose one option) – responsive.	Mobile-friendly, uniform button/card styles.
9	Implement role-based UI: show "Skilled" or "Client" specific navigation links.	Conditional rendering based on user role in Firestore.
10	Commit code regularly to GitHub branch <code>feature/module-a</code> .	All code versioned, ready for merge.

Dependencies

- Firebase project setup (do this first).
- DDS color/spacing decisions confirmed by Person 2.

Acceptance Criteria

- A user can sign up, verify email/phone, log in, and see a tailored profile page.
- Profile data persists in Firestore and can be edited.
- Styling matches the chosen DDS color option exactly.
